

1. PROJECT OVERVIEW

- **Project Title:** ComicCraft - AI Comic Story Creator using Gemini Models

2. BRAINSTORMING OBJECTIVE :

The team conducted a brainstorming session to determine the most effective technological approach for automating the comic creation pipeline, ensuring maximum accessibility for non-technical users.

3. EVALUATION OF PROPOSED CONCEPTS

- **Concept A: Interactive AI Canvas.** A web app where users manually request AI images, drag them onto a digital canvas, and type their own text boxes. (Discarded: This approach still requires too much manual effort and design intuition from the user).
- **Concept B: AI Scriptwriter Only.** A tool that simply expands a user's prompt into a professional comic script format for a human artist to read. (Discarded: This only solves the writing problem and ignores the primary visual bottleneck).
- **Concept C: Fully Autonomous End-to-End Pipeline.** A system that accepts a prompt, uses an LLM to generate the script, passes that script to an Image AI, and programmatically compiles the final PDF. (Selected: This provides the most frictionless experience and delivers a complete end product).

4. FEATURE PRIORITIZATION To execute Concept C successfully within the development timeframe, the following features were prioritized:

- **High Priority (Must-Have for MVP):**
 - A robust FastAPI backend capable of handling asynchronous API requests.
 - Integration with Gemini 1.5 Flash for generating a strict, logical JSON story outline.

- Integration with Hugging Face Stable Diffusion for instant panel rendering.
- An automated FPDF compiler to generate the final downloadable document.
- **Medium Priority (Should-Have):**
 - A dynamic web interface (HTML/Jinja2) allowing users to preview the comic in their browser before downloading.
 - UI dropdowns for users to easily select artistic styles (e.g., Anime, Sketch) and emotional tones.
- **Low Priority (Future Enhancements):**
 - Cloud database integration to save past creations.
 - Multi-page, long-form graphic novel generation capabilities.
- **Out of Scope (Won't-Have):**
 - Manual image retouching tools (like a digital brush or eraser) built into the browser interface.
