

1. PROJECT OVERVIEW

- **Project Title:** ComicCraft - AI Comic Story Creator using Gemini Models

2. HIGHLIGHTS OF CAPABILITIES The project demonstration is designed to validate the practical implementation of ComicCraft, proving that the tool successfully bridges the gap between purely textual ideas and fully formatted visual publishing.

3. CORE CAPABILITIES TO BE SHOWCASED

- **Intuitive Data Capture:** Showcasing the HTML/Jinja2 interface that seamlessly collects user preferences (genre, character, prompt) without requiring any prompt-engineering expertise.
- **Algorithmic Story Structuring (Gemini Flash):** Demonstrating the backend's capacity to dissect a broad prompt into a rigid, 5-part JSON logical sequence.
- **Contextual Scripting (Gemini Pro):** Highlighting the integration of the secondary LLM to flesh out the JSON structure with rich narratives and dialogues.
- **Dynamic Visual Synthesis (Stable Diffusion):** Exhibiting the autonomous generation and downloading of high-resolution, genre-accurate panel illustrations.
- **Algorithmic PDF Compilation (FPDF):** The final output generation, proving that the Python backend can mathematically align the generated images and text into a polished, downloadable document.
