

1. PROJECT OVERVIEW

- **Project Title:** ComicCraft - AI Comic Story Creator using Gemini Models

2. PRESENTATION STRATEGY:

To effectively showcase the sophisticated backend AI orchestration within a limited presentation window, a structured demonstration roadmap has been formulated. This ensures that evaluators can clearly witness both the frontend simplicity and the backend complexity.

3. SEQUENTIAL DEMO ROADMAP

- **Step 1: Server Initialization:** The presentation will commence with the activation of the Python virtual environment and the launch of the Uvicorn ASGI server, confirming the codebase is fully functional locally.
- **Step 2: Parameter Selection:** The presenter will navigate the web UI, submitting a unique, unscripted story prompt to prove the AI's real-time generation capabilities.
- **Step 3: Background Orchestration Monitoring:** While the UI is loading, the presenter will display the backend terminal logs, offering visibility into the live asynchronous HTTPS requests being made to Google and Hugging Face.
- **Step 4: Web Verification:** The rendered interactive preview page will be evaluated to verify the logical continuity of the Gemini-generated text and the relevance of the Stable Diffusion illustrations.
- **Step 5: Offline Export Validation:** The demo concludes by triggering the download function and opening the resulting .pdf file to validate the dimensional accuracy of the FPDF layout engine.
